                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 687, Application US/09989789

Patent No. US2020063379A1

GENERAL INFORMATION:

GENERAL INFORMATION:

APPLICANT: LILIU, Qiang

TITLE OF INVENTION: POSTITON DEPENDENT RECOGNITION OF GNN NUCLEOTIDE

TITLE OF INVENTION: TRIPLETS BY ZINC FINGERS

FILE REFERENCE: 8325-0011.20 / S11-US2

CURRENT APPLICATION UNMERR: US/09/989,789

CURRENT FILING DATE: 2002-03-25

NUMBER OF SEQ ID NOS: 4085

SOFTWARE: PatentIN Ver. 2.0

SEQ ID NO 687
                                                                                                                                                                                                                                          Sequence 686, Application US/09989789

Sequence 1711, Application US/09989789

Patent No. US20020063379A1

GENERAL INFORMATION:

APPLICANT: LIU, Qiang

TITLE OF INVENTION: POSTITON DEPENDENT RECOGNITION OF GNN NUCLEOTIDE

TITLE OF INVENTION: TRIPLETS BY ZINC FINGERS

FILE REFERENCE: 8325-0011.20 / S11-US2

CURRENT APPLICATION NUMBER: US/09/989,789

CURRENT FILING DATE: 2002-03-25

NUMBER OF SEQ ID NOS: 4085

SOOTWARE: PATENTIN Ver. 2.0

Sequence 1382, Application US/09989789

Patent No. US20020663379A1

GENERAL INFORMATION:
APPLICANT: LIU, Qiang
TITLE OF INVENTION: POSITION DEPENDENT RECOGNITION OF GNN NUCLEOTIDE
TITLE OF INVENTION: TRIPLETS BY ZINC FINGERS
FILE REPRESENCE: 8325-0011.20 / S11-US2
CURRENT APPLICAND NUMBER: US/09/989,789

CURRENT FILING DATE: 2002-03-25
NUMBER OF SEQ ID NOS: 4085
SOFTWARE: Patentin Ver. 2.0

SEQ ID NO 1382
LENGTH: 7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 894, Application US/09989789
Patent No. US20020063379A1
GENERAL INCORPATION:
APPLICANT: LIU, Qiang
TITLE OF INVENTION: TRIPLETS BY ZINC FINGERS
TITLE OF INVENTION: TRIPLETS BY ZINC FINGERS
FILE REFERENCE: 8325-0011.20 / S11-US2
CURRENT APPLICATION NUMBER: US/09/989, 789

Screening compound for interaction with molecular target by contacting compound with cells, comprising exogenous zinc finger protein that modulates expression of target, and determining values of properties of Human, KCA4; EPO; molecular target; zinc finger protein; ZFP; cellular process; signal transduction; drug-screening. Human KCA4 protein Fl recognition helix. AAE08727 standard; peptide; 7 AA (SANG-) SANGAMO BIOSCIENCES INC. 08-FEB-2001; 2001WO-US004301. 08-FEB-2000; 2000US-0181117P. (first entry) WPI; 2001-522491/57. WO200159450-A2 Homo sapiens. 15-NOV-2001 16-AUG-2001. AAE08727; Case C; AAE0872

Example 10; Page 73; 99pp; English.

The invention relates to a method of screening a compound for interaction with a molecular target. The method involves contacting first and second cells with the compound and determining the values of properties of the compound. The second cell comprises an exogenous zinc finger protein (ZFP) that modulates the expression of the molecular target, or isolating membranes from cell comprising ZFP. The methods allow for high throughput screening of candidate compound and reduces the incidence of false positives. The methods are useful for screening a compound for interaction with a molecular target or for screening a compound for its effect on a cellular process. The method is useful for testing a compound for its capacity to transduce a signal to the molecular target or its capacity to block transduction of a signal through the molecular target,

                                                                                                                                                                                                                                               g
                                                                                                                                                                                                                                                                                                                                                The invention relates to regulating the expression of a gene residing in the chromatin of a cell. The method involves identifying one or more accessible regions in cellular chromatin associated with gene; designing a regulatory molecule, where the regulatory molecule comprises a DNA-binding domain targeted to a sequence within the accessible region, and contacting the regulatory molecule with the cell. The method is used for regulating the expression of a gene (e.g., a gene encoding a nuclear receptor such as estrogen receptor alpha (BRalpha), certogen receptor beta (ERbeta), hepatocyte nuclear factor 4 alpha (CMRyalpha), papatocyte nuclear factor 4 gamma (HNRyalpha), retinoid X receptor alpha (ARRalpha), constitutively active receptor alpha (CARalpha)).

Calpha (AXRalpha), or constitutively active receptor alpha (CARalpha)) residing in the chromatin of a cell. Regulation of gene expression (such as nuclear receptor games) will be useful in treatment of various chiesase, including cancer, diabetes and cardiovascular disease, where the regulatory molecule as described above, is contacted with the cell to carry out the regulation. The method is also useful for modulation of gene expression for therapeutic or prophylactic applications e.g., diabeter retinopathy, ischaemia, macular degeneration, rheumatoid arthritis, psoriasis, HIV infection, sickle cell anemia, Alzheimer's

ö
disease, stroke, etc. The method also has applications in pharmaceutical research of both nuclear receptors of known function as well as those of unknown function. The method also facilitates development of tissue and animal models of disease states, drug validation, and therapeutic product development. The methods also allow identification of the role of nuclear receptors of unknown functions in cellular homeostaais. Sequences ABB80791-817 represent zinc finger protein (ZFP) DNA-binding domains that were fused to functional domains and tested for their ability to regulate expression of the ER in living cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New heparanase polynucleotide, useful for controlling disease states such as tumor metastasis, inflammatory diseases and allograft rejection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to novel heparanase sequences, particularly novel sequences from the regulatory regions upstream and downstream of the coding region. The activity of polymucleotides of the invention may be described as, cytostatic, vasotropic, antidiabetic, anti-HIV, ophthalmological, antitheumatic, antiarthritic, antipsoriatic, antianaemic, neuroprotective, nootropic, cerebroprotective, antibacterial, virucide, protozoacide, fungicide, antinflammatory, cardiant and immunosuppressive. Modulating expression of heparanase gene using constructs of the invention is useful for facilitating targeted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; heparanase; cytostatic; vasotropic; antidiabetic; anti-HIV; ophthalmological; antirheumatic; antiarthritic; antipsoriatic; antipsoriatic; antibacentive; neuroprotective; notropic; cerebroprotective; antibacterial; virucide; protozoacide; fungicide; antiinflammatory; cardiant; immunosuppressive; tumour metastasis; inflammatory disease; allograft rejection; cell migration; anglogenesis; basement membrane; extracellular matrix; cancer; ischaemia; diabetic retinopathy; macular degeneration; rheumatoid arthritis; psoriasis; HIV infection; sickle cell anaemia; Alzheimer's disease; macular dystrophy; neurodegenerative disease; vascular disease; candiovascular disease; cystic fibrosis; stroke; gene therapy; zinc finger protein; ZFP.

ö
control of disease states such as tumour metastasis, inflammatory diseases, allograft rejection, and for inhibiting processes such as cell migration, angiogenesis, and degradation of the basement membrane and/or extracellular matrix. Heparanase-targeted DNA binding domains modulates gene expression, and are useful for therapeutic or prophylactic applications, for e.g. cancer, ischaemia, diabetic retinopathy, macular degeneration, rheumatoid arthritis, psoriasis, HIV infection, sickle cell anaemia, Alzheimer's disease, unscular dystrophy, neurodegenerative disease, vascular disease, cardiovascular disease, cystic fibrosis, stroke, and bacterial, protozoal, fungal and viral infection. Constructs of the invention may also be useful in gene therapy. The current sequence represents a finger of a three-finger ZFP (zinc finger protein), which has a target site in the human heparanase gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New heparanase polynucleotide, useful for controlling disease states such as tumor metastasis, inflammatory diseases and allograft rejection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; heparanase; cytostatic; vasotropic; antidiabetic; anti-HIV; ophthalmological; antirheumatic; antiarthritic; antipsoriatic; antianaemic; neuroprotective; nootropic; cerebroprotective; cardiant; neuroprotective; nootropic; cerebroprotective; cardiant; immunosupessive; tumour metastasis; inflammatory; cardiant; immunosupessive; tumour metastasis; inflammatory disease; extracellular matrix; cancer; ischaemia; diabetic retinopathy; macular degeneration; rheumatoid arthritis; psoriasis; HIV infection; sickle cell anaemia; Alzheimer's disease; muscular dystrophy; neurodegenerative disease; vascular disease; cardiovascular disease; cystic fibrosis; stroke; gene therapy; zinc finger protein; ZFP.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           8
```

The invention relates to novel heparanase sequences, particularly novel sequences from the regulatory regions upstream and downstream of the coding region. The activity of polynucleotides of the invention may be described as, cytostatic, vasotropic, antidiabetic, anti-HIV, ophthalmological, antirheumatic, antiarthritic, antipsoriatic,

Also described are: (1) a polypeptide (II) comprising (I); (2) a polymucleotide (III) encoding (I) or (II); and (3) designing (M) (I) involves selecting the F1 zinc finger such that it binds to the S1 target subsite, and selecting the F3 zinc finger such that it binds to the S2 target subsite, and selecting the F3 zinc finger such
                                                                         control of disease states such as tumour metastasis, inflammatory diseases, allograft rejection, and for inhibiting processes such as cell migration, angiogenesis, and degradation of the basement membrane and/or extracellular matrix. Heparansec-targeted DNA binding domains modulates gene expression, and are useful for therapeutic or prophylactic applications, for e.g. cancer, ischaemia, diabetic retinopathy, macular degeneration, rheumatoid arthritis, psoriasis, HIV infection, includation and arthritis, psoriasis, HIV infection, sickle cell anaemia, Alzheimer's disease, unscular disease, cardiovascular disease, cystic fibrosis, stroke, and bacterial, protozoal, fungal and viral infection. Constructs of the invention may also be useful in gene therapy. The current sequence represents a finger of a three-finger ZFP (zinc finger protein), which has a target site in the human heparanase gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New zinc finger protein that binds to target site, useful in studying gene function and for human therapeutics and plant engineering, comprises first, second and third zinc fingers, ordered from N- to C-terminus.
antianaemic, neuroprotective, nootropic, cerebroprotective, antibacterial, virucide, protozoacide, fungicide, antiinflammatory, cardiant and immunosuppressive. Modulating expression of heparanase gene using constructs of the invention is useful for facilitating targeted
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

ö
that it binds to the S3 target subsite, thus designing (1) that binds to a target site. (1) is useful for recognition of triplet target subsites having the mucleotide G in the 5'-most position of the subsite. (1) is useful in studying gene function, and for human therapeutics and plant engineering. (1), (II) or (III) is useful in therapeutic methods to modulate the expression of a target region within a subject, in diagnostic methods for sequence specific detection of target nucleic acid in a sample, and in assays to determined the phenotype and function of gene expression. (1) has improved affinity and specificity for their rarget sequences, as well as enhanced biological activity. ABQ71213 to ABQ72214 and ABP48191 to ABP61230 repersent DNA target sequences and zinc finger peptides which are given in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes a zinc finger protein (I) that binds to a target site, comprising a first (F1), a second (F2), and a third (F3) zinc finger, ordered F1, F2, F3 from N-terminus to C-terminus, where the target site comprises in 3'-5' direction, a first (S1), a second (S2), and a third (S3) target subsite. Also described are: (I) a polypeptide (II) comprising (I); (2) a polymucleotide (III) encoding (I) or (II); and (3) designing (M) (I) involves selecting the F1 zinc finger such that it binds to the S1 target subsite, selecting the F2 zinc finger such that it binds to the S1 target subsite, and selecting the F3 zinc finger such that it binds to the S3 target subsite, thus designing (I) that binds to a target subsite, and selecting the F3 zinc finger such that it binds to the S3 target subsite, thus designing (I) that binds to a target site. (I) is useful for recognition of triplet target subsites having the nucleotide of in the 5'-most position of the subsite. (I) is useful in studying gene function, and for human therapeutics and plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New zinc finger protein that binds to target site, useful in studying gene function and for human therapeutics and plant engineering, comprises first, second and third zinc fingers, ordered from N- to C-terminus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ..

The present invention describes a zinc finger protein (I) that binds to a target site, comprising a first (FI), a second (F2), and a third (F3) zinc finger, ordered F1, F2, F3 from N-terminus to C-terminus, where the target site comprises, in 3.-5' direction, a first (S1), a second (S2), and a third (S3) target subsite. Also described are: (I) a polypebtide (II) comprising (I); (2) a polynucleotide (III) encoding (I) or (II); and (S) target subsite, selecting the F1 zinc finger such that it binds to the S1 target subsite, and selecting the F2 zinc finger such that it binds to the S2 target subsite, and selecting the F3 zinc finger such that it compared to the S2 target subsite, thus designing (I) that binds to a target site. (I) is useful for recognition of triplet target subsites (A aving the nucleotide G in the 5'-most position of the subsite. (I) is useful in studying gene function, and for human therapeutics and plant complete the expression of a target region within a subject, in diagnostic methods for sequence specific detection of target nucleic acid in a sample, and in assays to determined the phenotype and function of
                                                                                                                                                                                                                                                                                         ö
engineering. (I), (II) or (III) is useful in therapeutic methods to modulate the expression of a target region within a subject, in diagnostic methods for sequence specific detection of target nucleic acid in a sample, and in assays to determined the phenotype and function of gene expression. (I) has improved affinity and specificity for their target sequences, as well as enhanced biological activity. ABQ71213 to ABQ72214 and ABP48191 to ABP51230 represent DNA target sequences and zinc finger peptides which are given in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New zinc finger protein that binds to target site, useful in studying gene function and for human therapeutics and plant engineering, comprises first, second and third zinc fingers, ordered from N- to C-terminus.
                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                           ..

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a zinc finger protein (I) that binds to a target site, comprising a first (FI), a second (F2), and a third (F3) condered FI, F2, F3 from N-terminus to C-terminus, where the carget site comprises, in 3'-5' direction, a first (SI), a second (S2), target site comprises, in 3'-5' direction, a first (SI), a second (S2), and a third (S3) target subsite. Also described are: (I) a polypeptide (CI) comprising (I); (2) a polynuclectide (III) encoding (I) or (III); and (CI) in our selecting the F1 zinc finger such that it binds to the S1 target subsite, and selecting the F2 zinc finger such that it comparison (I) is useful for recognition of triplet target subsites that it binds to the S3 target subsite, thus designing (I) that binds to the S1 target subsite, thus designing (I) that binds to the S1 target subsite, thus designing (I) that binds to the S1 target subsite, thus designing (I) that binds to the S1 target subsite, thus designing (I) is useful in studying gene function, and for human therapeutics and plant cuspineering (II) or (III) is useful in therapeutic methods to modulate the expression of a target region within a subject, in classing the ansays to determined the phenotype and function of a sample, and in assays to determined the phenotype and function of target sequences, as well as enhanced biological activity. ABQ11213 to the Earget peptides which are given in the exemplification of the present
                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New zinc finger protein that binds to target site, useful in studying gene function and for human therapeutics and plant engineering, comprises first, second and third zinc fingers, ordered from N- to C-terminus.
gene expression. (I) has improved affinity and specificity for their target sequences, as well as enhanced biological activity. AB071213 to AB071214 and ABP48191 to ABP51210 represent DNA target sequences and zinc finger peptides which are given in the exemplification of the present

The present invention describes a zinc finger protein (I) that binds to a target site, comprising a first (FI), a second (F2), and a third (F3) carget site, comprising a first (FI), a second (F2), and a third (F3) carget site comprises, in 3'-5' direction, a first (S1), a second (S2), and a third (S3) target subsite. Also described are: (I) a polypeptide (CT) comprising (I); (2) a polynucleotide (III) encoding (I) or (II) is and (I) involves selecting the F1 zinc finger such that it binds to the S1 target subsite, selecting the F2 zinc finger such that it comprises to the S2 target subsite, and selecting the F3 zinc finger such that it binds to the S3 target subsite, thus designing (I) that binds to that it binds to the S3 target subsite, thus designing (I) that binds to that it binds to the S3 target subsite, thus designing (I) that binds to that it binds to the S3 target subsite, thus designing (I) that binds to a target site. (I) is useful for recognition of triplet target subsites (CT) having the nucleotide (III) is useful in therapeutic methods to useful in studying gene function, and for human therapeutic methods to condulate the expression of a target region within a subject, in diagnostic methods for sequence specific detection of target nucleic acid in a sample, and in assays to determined the phenotype and function of target sequences, as well as enhanced biological activity. AB071213 to that it is expression. (I) has improved affinity and specificity for their carget sequences, as well as enhanced biological activity. AB071213 to incomplet the exemplification of the present
                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New zinc finger protein that binds to target site, useful in studying gene function and for human therapeutics and plant engineering, comprises first, second and third zinc fingers, ordered from N- to C-terminus.
                                                                                                                                                 Gaps

The present invention describes a zinc finger protein (I) that binds to a target site, comprising a first (FI), a second (F2), and a third (F3) card tinger, ordered FP, F2. F2 from N-terminus to C-terminus, where the crarget site comprises, in 3'-5' direction, a first (S1), a second (S2), and a third (S3) target subsite. Also described are: (I) a polypeptide (II) encoding (I) or (II) and (II) involves selecting the F1 zinc finger such that it binds to the S1 target subsite, selecting the F2 zinc finger such that it comparising (M) (I) involves selecting the F2 zinc finger such that it binds to the S1 target subsite, and selecting the F3 zinc finger such that it compared to the S3 target subsite, then designing (I) that binds to the S3 target subsite, then designing (I) that binds to the S3 target subsite, then designing (I) that binds to the S3 target subsite, then designing (I) that binds to the S1 target subsite, then designing (I) that binds to the S1 target subsite, then designing (I) that binds to useful in studying gene function, and for human therapeutic methods to modulate the expression of a target region within a subject, in diagnostic methods for sequence specific detection of target nucleic acid in a sample, and in assays to determined the phenotype and function of target sequences, as well as enhanced biological activity. ABG71213 to ABG72214 and ABG72214 and ABG72213 to especial in the expression of the present confidence the present in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New zinc finger protein that binds to target site, useful in studying gene function and for human therapeutics and plant engineering, comprises first, second and third zinc fingers, ordered from N- to C-terminus.
                                                                                                                                                                                                                                                                                                                Zinc finger protein; ZFP; DNA binding protein; zinc finger.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Length 7;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a zinc finger protein (I) that binds to a target site, comprising a first (F1), a second (F2), and a third (F3) and zinc finger, ordered F1. F2. F3 from N-terminus to C-terminus, where the carget site comprises, in 3.5' direction, a first (S1), a second (S2), and a third (S3) target subsite. Also described are: (1) a polypeptide (II) comprising (I); (2) a polynucleotide (III) encoding (I) or (II); and (S1) designing (I); (1) involves selecting the F1 zinc finger such that it binds to the S1 target subsite, and selecting the F2 zinc finger such that it binds to the S3 target subsite, thus designing (I) that binds to the S1 target subsite, and selecting the F3 zinc finger such that it binds to the S3 target subsite, thus designing (I) that binds to the S1 target subsite, thus designing (I) that binds to a target site. (I) is useful for recognition of triplet target subsites (C1) a target subsite, thus designing (I) that binds to useful in studying gene function, and for human therapeutics and plant engineering. (I), (II) or (III) is useful in therapeutic methods to compliance specific detection of target nucleic acid diagnostic methods for sequence specific detection of target nucleic acid in a sample, and in assays to determined the phenotype and function of target sequences, as well as enhanced biological activity, AB071213 to AB072214 and ABP48191 to ABP51230 represent DNA target sequences and zinc invarient continuation in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

The present invention describes a zinc finger protein (I) that binds to a target site, comprising a first (FI), a second (F2), and a third (F3) and carget site, comprising a first (FI), a second (F2), and a third (F3) and a third (F3) target site comprises, in 3'-5' direction, a first (S1), a second (S2), and a third (S3) target subsite. Also described are: (I) a polypeptide (CI) comprising (I); (2) a polymucleotide (III) encoding (I) or (III); and (I) involves selecting the F1 zinc finger such that it binds to the S1 target subsite, and selecting the F2 zinc finger such that it comprising (M) (I) involves selecting the F2 zinc finger such that it compared to the S2 target subsite, and selecting the F2 zinc finger such that it compared to the S3 target subsite, thus designing (I) that binds to the S3 target subsite, thus designing (I) that binds to the S3 target subsite, thus designing (I) that binds to a target side (I) the S'-most position of the subsite. (I) is useful in studying gene function, and for human therapeutic and plant companies the expression of a target region within a subject, in changed for sequence specific detection of target nucleic acid in sample, and in assays to determined the phenotype and function of the subsiter of target sequences, as well as enhanced biological activity, AB071213 to their comparion to peptides which are given in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New zinc finger protein that binds to target site, useful in studying gene function and for human therapeutics and plant engineering, comprises first, second and third zinc fingers, ordered from N- to C-terminus.
                                                                                                                                                                                Zinc finger protein; ZFP; DNA binding protein; zinc finger.
                                                                                                                        Zinc finger protein related peptide motif SEQ ID NO:2640.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0; Indels

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           target site, comprising a first (F1), a second (F2), and a third (F3) carget site, comprising a first (F1), a second (F2), and a third (F3) carget site comprises, in 3'-5' direction, a first (S1), a second (S2), and a third (S3) target subsite. Also described are: (1) a polypeptide (T1) comprising (I); (2) a polymucleotide (I11) encoding (I) or (I1); and third (S3) target subsite, selecting the F1 zinc finger such that it binds to the S1 target subsite, selecting the F2 zinc finger such that it binds to the S2 target subsite, selecting the F3 zinc finger such that it binds to the S3 target subsite, thus designing (I) that binds to the S2 target subsite, thus designing (I) that binds to the tracet site. (I) is useful for recognition of triplet target such that it binds to the S3 target subsite, thus designing (I) that binds to useful in studying gene function, and for human therapeutics and plant custum the tudying gene function, and for human therapeutic methods to modulate the expression of a target region within a subject, in charget sequence specific detection of target nucleic acid diagnostic methods for sequence specific detection of target nucleic acid in a sample, and in assays to determined the phenotype and function of target sequences, as well as enhanced biological activity. AB071213 to the AB072214 and AB0848191 to AB051230 represent DNA target sequences and zinc finger peptides which are given in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New zinc finger protein that binds to target site, useful in studying gene function and for human therapeutics and plant engineering, comprises first, second and third zinc fingers, ordered from N- to C-terminus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                present invention describes a zinc finger protein (I) that binds to a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     임
                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a zinc finger protein (I) that binds to a target site, comprising a first (F1), a second (F2), and a third (F3) target site, comprising a first (F1), a second (F2), and a third (F3) target site comprises, in 3'-5' direction, a first (G1), a second (S2), and a third (S3) target subsite. Also described are: (I) a polypeptide (II) comprising (I); (2) a polymuclectide (III) encoding (I) or (II); and (I) involves selecting the F1 zinc finger such that it binds to the S1 target subsite, selecting the F2 zinc finger such that it binds to the S1 target subsite, and selecting the F3 zinc finger such that it binds to the S3 target subsite, and selecting of F3 zinc finger such that it binds to the S3 target subsite, in description of triplet target subsites a target site. (I) is useful for recognition of triplet target subsites a target site. (I) is useful for recognition of the subsite. (I) is useful in studying gene function, and for human therapeutic methods to modulate the expression of a target region within a subject, in diagnostic methods for sequence specific detection of target nucleic acid in a sample, and in assays to determined the phenotype and function of the sample, and in assays to determined the phenotype and function of target sequences, as well as enhanced alfinity and specificity for their target sequences, as well as enhanced biological activity. ABQ71213 to ABQ72214 and ABB74230 represent DNA target sequences and zinc finger peptides which are given in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .

The present invention describes a zinc finger protein (I) that binds to a target site, comprising a first (FI), a second (F2), and a third (F3) and cardered F1, F2, F3 from N-terminus to C-terminus, where the card a third (S3) target subsite. Also described are: (I) a polypeptide (II) comprising (I); (2) a polyhucleotide (III) encoding (I) or (III); and (II) designing (I); (2) a polyhucleotide (III) encoding (I) or (III); and (I) involves selecting the F1 zinc finger such that it binds to the S1 target subsite, selecting the F2 zinc finger such that it comparison (I) is useful for recognition of triplet target subsites that it binds to the S3 target subsite, thus designing (I) that binds to the S1 target subsite, thus designing (I) that binds to the S3 target subsite, thus designing (I) that binds to the S3 target subsite, thus designing (I) that binds to the tit binds to the S3 target subsite, thus designing (I) that binds to useful in studying gene function, and for human therapeutic subsites (I) is useful in therapeutic methods to modulate the expression of a target region within a subject, in diagnostic methods for sequence specific detection of target nucleic acid in a sample, and in assays to determined the phenotype and function of the subsites. (I) as suppression (I) has improved affinity and specificity for their target sequences, as well as enhanced biological activity, AB071213 to their finger peptides which are given in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                            December 27, 2004, 21:40:45; Search time 20 Seconds (without alignments) 23.211 Million cell updates/sec

Sequence 14, Application US/09731558
Patent NO. 6503717
GENERAL INFORMATION:
APPLICANT: Case, Casey Christopher
APPLICANT: Liu, Qiang
APPLICANT: Sangame Blosciences, Inc.
TITLE OF INVENTION: Methods of Using Randomized Libraries of Zinc Finger
TITLE OF INVENTION: Proteins for the Identification of Gene Function
FILE REFERENCE: 019496-0003210US
CURRENT APPLICATION NUMBER: US/09/731,558
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                       (without alignments)
28.393 Million cell updates/sec
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 30, 2

Sequence 15, Application US 0607882

APPLICANT: Case, Casey Christopher

APPLICANT: Eisenberg, Stephen P.

APPLICANT: Spratt, Sharon K.

TITLE OF INVENTION: REQUIATION OF ENDOGENOUS GENE EXPRESSION IN CELLS

TITLE OF INVENTION: USING ZING FINGER PROTEINS

FILE REFERENCE: 8325-0002.10 / S2-US3

CURRENT FILING DATE: 2000-01-06

NUMBER OF SEQ ID NOS: 43

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

TITLE OF INVENTION: Proteins for the Identification of Gene Function

FILE REFERENCE: 019456-001210US

CURRENT APPLICATION NUMBER: US/09/731,558
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Patent No. 6607882

GENERAL INFORMATION:

APPLICANT: Case, Casey Christopher

APPLICANT: Case, Casey Christopher

APPLICANT: Elsenberg, Stephen P.

APPLICANT: Spratt, Sharon K.

TITLE OF INVENTION: REGULATION OF ENDOCENOUS GENE EXPRESSION IN CELLS

TITLE OP INVENTION: USING ZINC FINGER PROTEINS

TILLE APPLICANT: 3125-0002.10 / S2-US3

CURRENT APPLICATION NUMBER: US/09/478,681

CURRENT APPLICATION NUMBER: US/09/478,681

CURRENT FILING DATE: 2.00-01-06

NUMBER OF SEQ ID NOS: 43
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

Sequence 29, Application US/09716637

Sequence 29, Application US/09716637

Sequence No. 6794136

GENERAL INFORMATION:

APPLICANT: EISENBERG, Stephen P.

APPLICANT: LIV. Qiang

APPLICANT: TEBAR, Edward

TITLE OF INVENTION: IPERATIVE OPTIMIZATION IN THE DESIGN OF BINDING

TITLE OF INVENTION: PROTEINS

TITLE OF INVENTION: PROTEINS

TITLE OF INVENTION: PROTEINS

CURRENT APPLICATION NUMBER: US/09/716,637

CURRENT APPLICATION NUMBER: US/09/716,637

CURRENT PILING DATE: 2001-10-12

NUMBER OF SEQ ID NOS: 35

SOFTWARE: PATENTIN VET: 2.0

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                            Sequence 30, Application US/09478681

Sequence 30, Application US/09478681

Patent No. 6607882

GENERAL INFORMATION:

APPLICANT: Case, Casey Christopher

APPLICANT: Eisenberg, Stephen P.

APPLICANT: Spratt, Sharon K.

APPLICANT: Spratt, Sharon K.

TITLE OF INVENTION: REGILATION OF ENDOCENOUS GENE EXPRESSION IN CELLS

TITLE OF INVENTION: USING ZINC FINGER PROTEINS

TITLE OF INVENTION: USING ZINC FINGER

CURRENT APPLICATION NUMBER: US/09/478,681

CURRENT APPLICATION NUMBER: US/09/478,681

CURRENT PAPPLICATION NUMBER: US/09/478,681

CURRENT PAPPLICANTON NUMBER: US/09/478,681

Patent No. 650371.
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Case, Casey Christopher
APPLICANT: Liu, Qiang
APPLICANT: Rebar, Edward J.
APPLICANT: Sangamo Biosciences, Inc.
TITLE OF INVENTION: Methods of Using Randomized Libraries of Zinc Finger
TITLE OF INVENTION: Proceins for the Identification of Gene Function
FILE REPERENCE: 0190496-00321008
CURRENT APPLICATION NUMBER: US/09/731,558
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                         ; Search time 16.35 Seconds (without alignments) 28.393 Million cell updates/sec
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1: /cgn2 6/ptodata/1/iaa/5A COMB.pep:*

Zinc finger protein; vascular endothelial growth factor; VEGF; ischaemia; atherosclerosis; tumour; arthritis; bone injury; wound; ulcer; surgery; angiogenesis; pregnancy; embryogenesis; human; recognition helix.
                                                                                                                                                                                                                                                                                                                                                                                                                                         New zinc finger protein that binds to target site in vascular endothelial growth factor gene, useful for modulating expression of the gene and for treating atherosclerosis, ischemia, arthritis, wound or ulcer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a zinc finger protein that binds to a target site in one or more vascular endothelial growth factor (VEGF) genes. The protein is useful for modulating expression of a VEGF gene, thereby regulating angiogenesis and vasculogenesis. This can be used to treat atherosclerosis, ischaemia, arthritis, wounds, ulcers, tumours, diabetic retinopathy or psoriasis. The present sequence is a peptide shown in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ..

The invention relates to a zinc finger protein that binds to a target site. The zinc finger protein is useful for modulating expression of a vascular endothelial growth factor (VEGF) gene. The expression of a number of splice variants of 'VEGF gene is modulated. A number of target is sites are contacted with a number of zinc finger proteins and each zinc finger protein binds to a distinct target site. The zinc finger protein is administered in combination with a delivery vehicle, or its nucleic acid is administered into the cell, either in naked form or delivered in a expression vector. The zinc finger protein or nucleic acid is useful for treating a disease or injury such as atherosclerosis, ischaemia, tumour, arthritis, bone injury such as atherosclerosis, ischaemia, tumour, arthritis, bone injury wounds and ulcer in a subject. The zinc finger protein is also useful for modulating angiogenesis, by introducing the zinc finger protein into an animal, where the animal has a genome comprising a target site within a WEGF gene. The zinc finger protein and nucleic acid are also useful for creening for a modulator of expression of a VEGF gene. The zinc finger protein and nucleic acid are also useful for compus luteum and endometrium, which is useful for intilating and/or maintaining pregnancy and for supporting embryogenesis. The zinc finger protein and its nucleic acid are also useful in surgical applications. The present sequence represents the amino acid sequence of a human VEGF targeted zinc finger protein ZFP recognition helix
                                                        Novel zinc finger protein that binds to a target site, useful for modulating vascular endothelial growth factor gene expression, for modulating angiogenesis, for wound healing and for treating ischemia.
                                                                                                                                                                                      Disclosure, Page 43; 120pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 17, Application US/09731558

Sequence 17, Application US/09731558

Patent No. 6503717

GENERAL INFORMATION:

APPLICANT: Case, Casey Christopher

APPLICANT: Expandance of Casey Christopher

APPLICANT: Bangamo Biosciences, Inc.

TITLE OF INVENTION: Proteins for the Identification of Gene Function

TITLE OF INVENTION: Proteins for the Identification of Gene Function

FILE REFERENCE: 019496-003210US

CURRENT APPLICATION NUMBER: US/09/731,558

CURRENT FILING DATE: 2000-12-06

PRIOR FILING DATE: 1999-12-06

NUMBER OF SEQ ID NOS: 24

SEQ ID NO 17

LENGTH: 7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 17, Appl
Sequence 37, Appl
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                  (without alignments)
28.393 Million cell updates/sec

Patent No. 650371.
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Case, Casey Christopher
APPLICANT: Liu, Qiang
APPLICANT: Rebar, Edward J.
APPLICANT: Sangawo Bisosiences, Inc.
TITLE OF INVENTION: Methods of Using Randomized Libraries of Zinc Finger
TITLE OF INVENTION: Proceins for the Identification of Gene Function
FILE REPERENCE: 019496-003210105
CURRENT APPLICATION NUMBER: US/09/731,558
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                               (without alignments)
28.393 Million cell updates/sec
                                                                                                                                                                       December 27, 2004, 20:31:09; Search time 16.35 Seconds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1: /cgn2 6/ptodata/1/iaa/5A COMB.pep:*

i Sequence 30, Application US/09478681

patent No. 6607882

GENERAL INFORMATION:

APPLICANT: Cax III, George N.

APPLICANT: Case, Casey Christopher

APPLICANT: Bisenberg, Stephen P.

APPLICANT: Bisenberg, Stephen P.

APPLICANT: Bisenberg, Stephen P.

APPLICANT: Bisenberg, Stephen P.

TITLE OF INVENTION: REGULATION OF ENDOGENOUS GENE EXPRESSION IN CELLS

TITLE OF INVENTION: USING ZINC PINGER PROTEINS

TITLE OF INVENTION: USING ZINC PINGER PROTEINS

TILLE REFERENCE: 8325-0002.10 / 32-U33

CURRENT APPLICATION NUMBER: US/09/478,681

CURRENT APPLICATION NUMBER: US/09/478,681

CURRENT APPLICATION OFTE: 2000-01-06

NUMBER OF SEQ ID NOS: 43

CENTRAIN FILL NOS: 43

CORRIENT PRING DATE: 2000-01-06

SOFTWARE: PATENTING DATE: 2000-01-06

TYPE: PRT

CORRIENT PRING DATE: 2000-01-06

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
